All rights reserved.

No part of this publication may be reproduced by any mechanical, photographic, or electronic process, or in the form of a phonographic recording, nor may it be stored in a retrieval system, transmitted, or otherwise copied for public or private use, without permission from the publisher.

The game play, all graphic designs, and this technical manual are protected by the U.S. Copyright Act of 1976.

This Act provides for increased penalties for violating federal copyright laws. Courts *can impound* infringing articles while legal action is pending. If infringers are convicted, courts can *order destruction* of the infringing articles.

In addition, the Act provides for payment of statutory damages of up to \$250,000 in certain cases. Infringers may also have to pay costs and attorneys' fees and face an imprisonment of up to five years.

Atari Games Corporation will aggressively enforce its copyrights against any infringers. We will use all legal means to immediately halt any manufacture, distribution, or operation of a copy of video games made by us. Anyone who purchases such copies risks forfeiting such a game.

Power-Up Warning

Before making any servicing or testing, make certain that you use an isolation transformer between the AC supply and the AC plug of the video display. The chassis and the heat sink are *directly connected* to one side of the AC line, which could present a shock hazard.

Before making any servicing, read all the precautions on the CRT and chassis.

X-Ray Radiation Warning

Parts which influence X-ray radiation in the horizontal deflection and high-voltage circuits, the picture tube, etc., are indicated by a star (\star) in the parts list. When replacing these components, use **only** the type shown in the parts list.

High Voltage

This video display contains **high voltages** derived from power supplies capable of delivering **lethal** quantities of

energy. Do not attempt to service the video display until you have observed all precautions necessary for working on high-voltage equipment.

CRT Handling

Do not bump or scratch the picture tube because this may cause the picture tube to implode—resulting in injury. Shatter-proof goggles must be worn when handling the CRT. High voltage must be completely discharged before handling. Do not handle the CRT by the neck.

Product Safety Notice

For continued safety, replace safety-critical components **only** with manufacturer-recommended parts. These parts are identified by \triangle on the schematic diagram.

For replacement purposes, use the same type or specified type of wire and cable; make certain that you follow the positioning of the wires (especially for the high-voltage and power-supply circuits). Shock hazard, fire hazard, or video display damage may result if you use alternative wiring or positioning.

Specifications

Supply

Voltage

102-132 VAC

Frequency

50-60 Hz

NOTE

Apply supply voltage through an isolation transformer with 1 Amp. minimum capability.

High Voltage (EHT)

For 19-inch models 27.4 ± 0.8 kV at 0 mA Beam, 23.6 ± 0.8 kV at 0.75 mA Beam

Note: Condition for above is that line voltage equals $120 \,\mathrm{V}$

Table 1 Video Display Adjustment Controls

(VR402)

CRT Cut-off Controls: Red (VR403), Green (VR404), Blue (VR405)

Control Adjustments

NOTE

Horizontal vs. Vertical: Some models have the picture tube mounted vertically rather than horizontally. That is, the picture tube is mounted in the frame such that the long dimension of the tube is up and down. Other than the physical orientation of the picture tube, there is no electrical difference between these models and their horizontal counterparts. The vertical circuits produce and control deflection along the short dimension of the tube in all models.

The horizontal circuits produce and control deflection along the long dimension of the tube in all models. Therefore, wherever "vertical" appears in this manual or on the video display, the word refers to the *short* dimension of the picture tube; wherever "horizontal" appears, that word refers to the *long* dimension of the picture tube.

1.0 Black Level Control

This control has been set at the factory to 100 VDC (see Figure 10) and should not need further attention. However, when a game is connected to the video display, you may have to slightly adjust the screen control to obtain the proper black level (the black portion of the picture just extinguished).

2.0 Vertical Size (Height)

The location of this control is shown in Figure 1. If necessary, adjust this control slowly until the picture or test pattern has the correct vertical proportions.

NOTE

This adjustment interacts with the vertical damping adjustment described in the section below. You may have to readjust the vertical size after adjusting the vertical damping control.

3.0 Vertical Damping

You will have to adjust this control only if the video display is being used with a game in which the top several raster lines are visible on the screen. Adjust the vertical damping control for uniform spacing of the top raster lines.

4.0 Circuit Protection

A $4.0\,\mathrm{Amp}$ pigtail fuse is mounted on the Main Board. This fuse protects the power output circuit.

5.0 Focus

Adjust the focus control, located on the high-voltage unit (T352), for maximum overall definition and fine picture detail.

6.0 Horizontal Hold Control, VR351

You should allow a warm-up period of at least five minutes before aligning the video display. With the display being driven from the game signal, short TP601 to TP31. Adjust VR351 (see Figure 1) until the picture stops sliding horizontally. Remove the short.

7.0 Horizontal Video Position

If the video is off center on the raster, you can compensate somewhat by adjusting this control.

8.0 Vertical Raster Position

If the video is off center vertically, you can compensate somewhat by turning the vertical raster position control.

9.0 Horizontal Raster Position

If the video is off center horizontally, you can compensate somewhat by moving the horizontal raster position adjustment jumper to either position "R" or "L."

10.0 Horizontal Width

The horizontal width coil is adjusted with a hexagonal tuning tool. Adjust this control slowly, if necessary, until the picture or test pattern has the correct horizontal proportions.

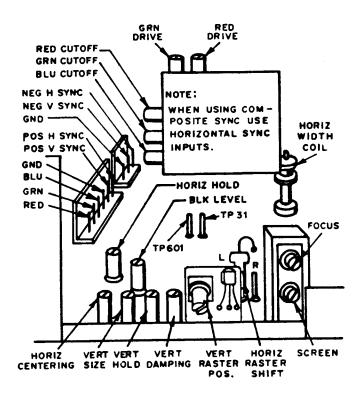

Figure 1

Servicing Adjustments

NOTE

After replacing any parts in the CRT assembly, you must make all five adjustments described in this section. Before making these adjustments, apply a suitable power source to the video display through an isolation transformer. Then apply a suitable signal source to the Main PCB through P201 and P202.

1.0 Degaussing

Summary: Demagnetize the shadow mask and all surrounding metal parts with an external degaussing coil.

All video displays are equipped with automatic degaussing coils (L701) that demagnetize the picture tube every time the video display is turned on after being off for a minimum of five minutes. Should any part of the chassis become magnetized, you will have to degauss the affected area with a manual degaussing coil. Move the coil slowly over the screen and over all surrounding metal parts. Then slowly withdraw the coil for a distance of 6 feet before turning off the coil.

2.0 Color Purity

Summary: Adjust the purity magnets and the yoke position to produce an overall uniform color.

NOTE

Purity and static convergence adjustments will interact. The video display must have been operating 15 minutes before you start this procedure.

- 2.1 For best results, we recommend that the purity adjustment be made after the video display is placed in its final location. If the display must be moved, make this adjustment with it facing east or west.
- 2.2 Set the converger assembly on the CRT neck with the centerline of the purity adjustment magnet over the gap between grids no. 3 and 4 (see Figures 2 and 6).
- 2.3 Make certain that the magnetic ring pairs are in their correct positions before starting this procedure. This produces a zero-correction condition on the CRT beam and helps you make adjustments.

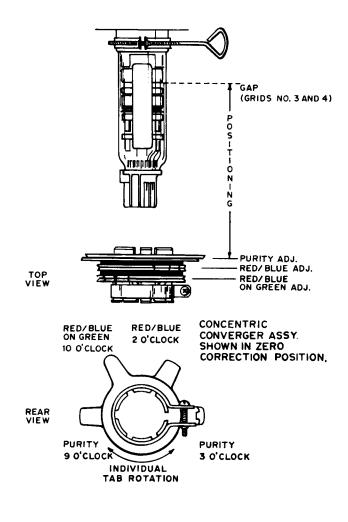

Figure 2

- 2.4 Make certain that the vertical raster position control is at the center of its rotation.
- 2.5 Remove the R/G/B signal from the video display.
- 2.6 Turn the green cutoff control (VR404) on the Neck Board fully clockwise (see Figure 3).
- 2.7 Turn the the red and blue cutoff controls (VR403 and VR405) fully counterclockwise.
- 2.8 Pull the deflection yoke backward so that a green belt appears on the screen (see Figure 4).
- 2.9 Decrease the horizontal width of the raster, if necessary, to see the right and left edges of the raster.

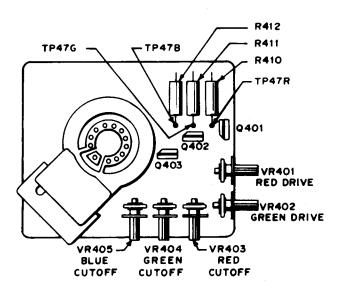

Figure 3 Neck Board—Component Side (With Horizontally Mounted CRT)

- 2.10 Move the two purity magnets with respect to each other to center the raster horizontally on the screen and the green belt on the raster horizontally.
- 2.11 Gradually push the deflection yoke forward; fix it at the place where the green screen becomes uniform throughout.
- 2.12 Turn the cutoff and drive controls. Confirm that each color is uniform.
- 2.13 If any color is not uniform, readjust it, moving the purity magnets slightly.
- 2.14 Turn all three cutoff controls fully counterclockwise. Slowly turn the red cutoff control up or clockwise until a red raster is just barely visible.
- 2.15 Slowly turn up the green and blue cutoff controls so that their associated colors, mixed with the red, result in a white or grey raster.
- 2.16 Make certain that the white or grey color is uniform throughout the screen.
- 2.17 Insert a wedge temporarily as shown in Figure 4; adjust the angle of the deflection yoke.

3.0 Static Convergence

Summary: Converge red and blue on green in the center of the screen.

3.1 Connect a crosshatch signal or grid pattern to the video display.

- 3.2 A pair of 4-pole convergence magnets is provided to converge the blue and red beams (see Figure 6). When the pole opens to the left and right 45° symmetrically, the magnetic field is maximized. Red and blue beams move to the left and right (see Figure 5). Vary the angle between the tabs to adjust the convergence of red and blue vertical lines.
- 3.3 Rotate both 4-pole convergence magnet tabs as a pair to adjust the convergence of the red and blue horizontal lines.
- 3.4 A pair of 6-pole convergence magnets is provided to converge the magenta (red + blue) to the green beams (see Figure 6). When the pole opens to the left and right 30° symmetrically, the magnetic field is maximized. Red and blue beams both move to the left and right (see Figure 5). Vary the opening angle to adjust the convergence of magenta to green vertical lines.
- 3.5 Rotate both 6-pole convergence magnet tabs as a pair to adjust the convergence of magenta to green horizontal lines.

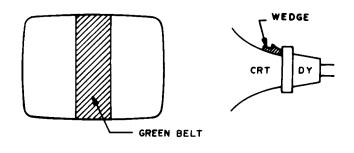

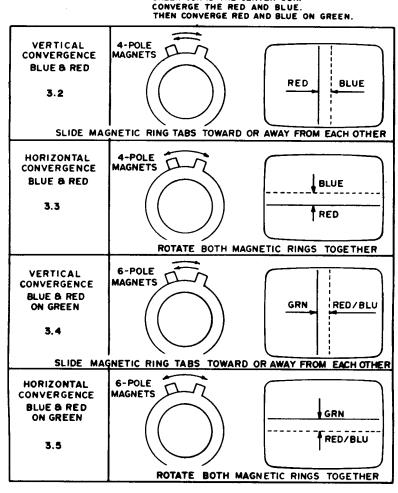

Figure 4

GREEN GUN IS THE CENTER GUN.

REPEAT 3.2 & 3.3 IF ALL LINES ARE NOT CONVERGED AT CENTER

Figure 5

4.0 Dynamic Convergence

Summary: Converge red and blue at the edges of the screen.

- 4.1 Feed a crosshatch signal or grid pattern to the video display.
- 4.2 Temporarily insert a rubber wedge as shown in Figure 7.
- 4.3 Tilt the angle of the yoke up and down to adjust the crossover of both vertical and horizontal red and blue lines. See Figure 8 (a) and (b).
- 4.4 Tilt the angle of the yoke sideways to adjust the parallel convergence of both horizontal and vertical

- lines at the edges of the screen. See Figure 9 (a) and (b).
- 4.5 After you have positioned the yoke, insert three more rubber wedges in the positions shown in Figure 7. Do NOT force the permanent wedges in: insert the wedges until they just make contact with the yoke.
- 4.6 Fix the three permanent rubber wedges with chloroprene rubber adhesive.
- 4.7 After the adhesive has dried enough to hold the wedges in place, carefully remove the temporarily installed wedge.

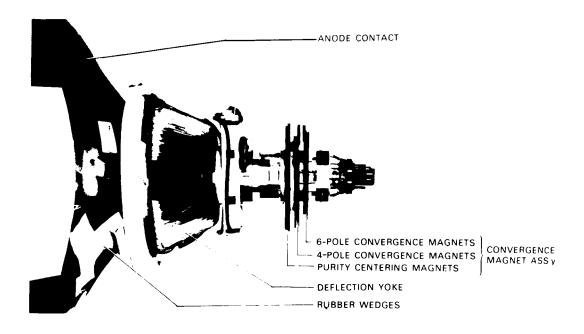

Figure 6

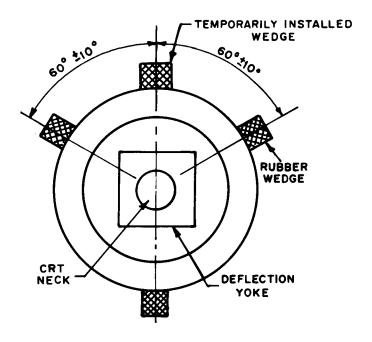

Figure 7

5.0 White Balance

Summary: Set the grey and white brightness tracking.

To adjust the white balance of the video display, you will need an oscilloscope with a DC-coupled mode in the vertical amplifier.

Refer to Figure 1 and 3 while doing the following adjustments in subdued light after degaussing and setting the purity of the CRT.

- 5.1 Ground the R/G/B video inputs.
- 5.2 Set the red and green drive controls, VR401 and VR402, to approximately 80% of fully clockwise rotation.
- 5.3 Set the screen and R/G/B cutoff controls to their minimum (fully counterclockwise) positions.
- 5.4 Connect the test equipment to the collector of a video output transistors (Q401, Q402, and Q403) on the CRT neck PCB at TP47R, TP47G, and TP47B

- (see Figure 3). Determine which color has the lowest black-level voltage. This is the lead color gun.
- 5.5 Adjust the black level control (VR201) of the lead color gun to obtain the waveform shown in Figure 10.
- 5.6 Slowly turn the screen control clockwise until the raster is just visible.
- 5.7 Adjust the screen control counterclockwise until the raster is just extinguished.
- 5.8 Connect a 1.5 VDC source to the R/G/B inputs. Then adjust the three cutoff controls for best grey uniformity.
- 5.9 Connect a 3.5 VDC source to the R/G/B inputs. Then adjust the R/G drive controls, if necessary, for best neutral white (7500° K).
- 5.10 Repeat steps 5.8 and 5.9 until you obtain good tracking of white balance.

Parts List

This monitor contains circuits and components included specifically for safety purposes. The two symbols described below are used in the parts list to mark components that you should replace only with exact factory replacement parts. Using substitute parts may create a shock, fire, radiation or other hazard. Only qualified personnel should perform service.

★ indicates parts that influence X-ray radiation in the horizontal deflection and high-voltage circuits, the picture tube, etc.

indicates safety-critical parts
